Beyond the Five Senses: Scientists Scientists Develop Method To Cool One Uncover Tactile Connection of Time of the World's Hottest Cities by 8°F

Sensory experiences and the perception of time are intricately linked within the somatosensory cortex of the brain. Here, the neural representations for both sensations are intertwined, being "multiplexed" within a shared neural network.

Time is felt, seen, and heard, yet there are no specific sensory receptors dedicated to perceiving time, unlike those for touch, sight, hearing, and smell. This fact has long tantalized neuroscientists with the possibility that sensing time might "piggyback" on true sensory modalities. New research in fact demonstrates that the percept of time embodied within a tactile experience is rooted in the dual functionality of the somatosensory cortex.

Professor Mathew Diamond and his SISSA research team recently published their findings in Nature Communications, shedding light on the intricate interplay between the sense of touch and the sense of time.

As we process stimuli received through the skin, neurons in the somatosensory cortex robustly represent the detailed features of the stimuli, culminating in the subjective experience of touch. However, was the stimulus brief or extended in time? How does the perception of elapsed time emerge? The research team's results indicate how the somatosensory cortex contributes to the perception of time.

Utilizing optogenetics, a technique enabling the modulation of neuronal activity through application of light to the cortex, the study established a connection between two seemingly distinct experiences - the "what" and the "how long" of a stimulus. In rats trained to assess vibration intensity while disregarding duration, optogenetic intervention influenced perceived intensity.

Conversely, in animals trained to evaluate vibration duration while disregarding intensity, optogenetic intervention influenced perceived duration. These findings not only affirm the expected function of the somatosensory cortex in constructing the tactile sense but also support the notion that the perception of time is rooted in a widespread network of brain areas with diverse functions, including touch. This research lays the foundation for future studies exploring the intricate relationship between sensory experiences and the perception of time.

A Widespread Network for Time Perception The neuronal mechanisms underlying the perception of the duration of sensory events are still not fully known," explains Professor Mathew Diamond, the research coordinator. "It is believed that, rather than relying on a single dedicated brain center, the perception

of time emanates from networks of neurons distributed across various brain regions. The study's findings demonstrate that the sensory processing stage of cortex is one component of the network. This means that one population of cortical neurons can give rise to two distinct sensory experiences, emphasizing the interconnected nature of time perception and touch."

A Study Exploiting Optogenetics

Previous work by the SISSA research group hinted at the integration and accumulation of impulses in the sensory processing pathway as a potential mechanism underlying time perception. Now, optogenetic techniques were employed to test this hypothesis directly, enabling the manipulation of neuron activity at a specific target location. Diamond explains: "If there is a behavioral effect of optogenetic intervention, the only explanation is that the target neurons are somehow involved. Targeting similar sets of neurons in the two groups of rats produced two different outcomes in their behavior. Increasing neuronal firing by optogenetics increased the perceived duration in the "duration' rats and increased the perceived intensity in the "intensity" rats. Since both percepts involve an overlapping set of neurons, we describe the two signals as "multiplexed" in the somatosensory cortex. As a final step, we constructed a mathematical model that goes from the physiology of cortical neurons to the final percept. The model points to potential cellular mechanisms for building elaborate percepts from neuronal firing.

The study concludes that the perception of time is intricately intertwined with touch, emerging within the tactile sensory representation. This insight opens the door to exploring the experience of time through the lens of sensory encoding, offering new avenues for understanding the complex relationship between sensing the external world and sensing time.

Engineering the Unbreakable: MIT's Microscopic Metamaterials Defy Supersonic Impacts

With high-speed vehicles, helmets, and supersonic impact better than cameras, the team then anything that needs to be a solid slab of the same captured images of each lightweight and protected."

A recent study from UNSW Sydney demonstrates that significant reductions in the temperatures of major cities located in hot desert climates can be achieved alongside decreases in energy expenses.

The findings, recently published in Nature Cities, detail a multi-faceted strategy to cool Saudi Arabia's capital city by up to 4.5°C, combining highly reflective 'super cool' building materials developed by the High-Performance Architecture Lab with irrigated greenery and energy retrofitting measures. The study, which was conducted in collaboration with the Royal Commission of Rivadh, is the first to investigate the largescale energy benefits of modern heat mitigation technologies when implemented in a city.

'The project demonstrates the tremendous impact advanced heat mitigation technologies and techniques can have to reduce urban overheating, decrease cooling needs, and improve lives," says

overheating. "Limited greenery city by nearly 8.1°F (4.5°C) during summer. The strategy would also improve cooling energy conservation for the citv by up to 16 percent.

The recommended heat mitigation (or cooling) scenario for Riyadh includes using super cool materials implemented in the roof of the buildings and more than doubling the number of irrigated trees to improve transpiration cooling.

On the contrary, a blind implementation of urban cooling techniques not based on detailed and advanced scientific optimization, like the use of non-irrigated greenery, may result in a substantial increase in the city's temperature.

"By implementing the right combination of advanced heat mitigation technologies and techniques, it is possible to decrease the ambient temperature at the precinct scale," says Prof. Santamouris. "For a sweltering city the size of Rivadh, significantly reducing cooling needs is also

New Research Reveals That Happiness Isn't Expensive

Many Indigenous peoples and local communities around the world are leading very satisfying lives despite having very little money according to new research from the Institute of Environmental Science and Technology at the Universitat Autònoma de Barcelona (ICTA-UAB). The study reveals that several communities with low monetary incomes experience life satisfaction levels on par with those found in affluent nations.

Economic growth is often prescribed as a sure way of increasing the well-being of people in low-income countries, and global surveys in recent decades have supported this strategy by showing that people in highincome countries tend to report higher levels of life satisfaction than those in lowincome countries. This strong

fringes, where the exchange of money plays a minimal role in everyday life and livelihoods depend directly on nature. The research, published in the scientific journal Proceedings of the National Academy of Sciences (PNAS), consisted of a survey of 2,966 people from Indigenous and local communities in 19 globally distributed sites. Only 64% of and oppression." The results surveyed households had any cash income. The results show that "surprisingly, many populations with very low monetary incomes report very high average levels of life satisfaction, with scores similar to those in wealthy countries," says Eric Galbraith, a researcher at ICTA-UAB and McGill University and lead author of the study. life The average satisfaction score across the studied small-scale societies not fundamentally required for

Although not all societies reported being highly satisfied - averages were as low as 5.1 - four of the sites reported average scores higher than 8, typical of wealthy Scandinavian countries in other polls, "and this is so, despite many of these societies having suffered histories of marginalization are consistent with the notion that human societies can support very satisfactory lives for their members without necessarily requiring high degrees of material wealth, as measured in monetary terms. The strong correlation frequently observed between income and life satisfaction is not universal and proves that wealth – as generated by industrialized economies - is small-scale societies on the was 6.8 on a scale of 0-10. humans to lead happy lives,"

Valsad rape survivor ends life hours after accused gets bail

SURAT: The Valsad police have launched an investigation into the suicide of a 22-year-old fashion designer, who hanged to death, hours after a man she accused of rape got bail on March 27.

The woman Shruti Pal (name changed) was found hanging in her boutique in Imperial Apartment on the coastal highway. Police also found a suicide note in the boutique in which the woman blamed the accused Mayur Patel, his family members, and his friend for harassment.

Later, another suicide note torn into pieces was recovered from the dustbin in the shop.

Intention of accused to aid suicide is a must says HC; quashes case against 8 of a family

material. What's more, the impact and its aftermath, with

Their work has identified few metamaterial architectures that are more nonarchitected counterparts. The researchers say the results they observed at the microscopic level can be extended to comparable macroscale impacts, to predict how new material structures across length scales will withstand impacts

in the real world. "What we're learning is, the microstructure of your material matters, even with high-rate deformation," says study author Carlos Portela,

include first author and MIT graduate student Thomas Butruille, and Joshua Crone of DEVCOM Army Research Laboratory. The team's new high-velocity experiments build off their previous work, in which the engineers tested the resilience of an ultralight, carbon-based material. That material, which was thinner than the width of a human hair, was made from tiny struts and beams of carbon, which the team printed and placed on a glass slide. They then fired microparticles toward the material, at velocities exceeding the speed

> of sound. Those supersonic experiments revealed that the microstructured material withstood the high-velocity impacts, sometimes deflecting the microparticles and other times capturing them.

"But there were many questions we couldn't answer because we were testing the materials on a substrate, which may have affected their behavior," Portela says.

WESTERN RAILWAY **COMPREHENSIVE ANNUAL** MAINTENANCE CONTRACT

Railway Managers Office, Mumba Mumbai-400 008 invites E entral. Fender No. SG 623/1699/WA dated 29.03.2024. Name of work Comprehensive Annual Maintenance Contract (CAMC) for complete Train Management System (TMS) installed at Central Control Office including system software, TMS application software modules, field equipments with system software and application software installed over Churchgate-Virar sectior of Western Railway, Mumbai Division, fo a period of One year. Approx. Cost of work: ₹4,90,47,716.88. Bid Security: ₹3,95,200/-. Time & Date for c for submission of E-Te Documents: At 15:00 Hr 22.04.2024. Time & Date for or of E-Tender: After 15:30 H 22.04.2024. consists of three phases. In the first, whole grapes are placed in vats full of carbon dioxide to create an oxygenfree atmosphere that leads to alcoholic fermentation inside the grains. When this fermentation takes place, many odors are released and the resulting wines have very fruity aromas, of banana and red fruits. After a few days, in the second phase, the macerated grains are pressed to complete the alcoholic fermentation. And in the third and last phase, malolactic fermentation is induced by the lactic acid bacteria in the wine. For the first time, a research team from the URV's

Biochemistry and Biotechnology Department has studied the effects of the Torulaspora delbrueckii yeast on carbonic macerátion wines, rosé wines, and orange wines. "Previous research had focused largely on traditional wines, white and red, and we have studied other less common vinifications. In addition, we have studied not only alcoholic fermentation but the whole process, from start to finish", explains Candela Ruiz de Villa, the principal researcher of the

project.

During the study, they inoculated strains of the yeast and observed what effect they MATERIAL MANAGEMENT DEPARTMENT **CORRIGENDUM TO E-AUCTION SALE PROGRAMME** -Auction Sale Notification No. SIII/Auction Programme-1/April-2024 dt-05/03/2024, the following corrigendum to above mentioned E-auction programme is being issued.
